WITH BOOSTER		375#	

Note: The required flowing water pressure to the dishwasher is 15-65 PSIG. If pressures higher than 65 PSIG are present, a pressure regulating valve must be installed in the water line to the dishwasher (by others). If flowing pressure is lower than 15 psi, improper machine operation may result.

2. Getting Started

2.1. Introduction to CMA-180

The CMA-180 is a hot water sanitizing, single rack, door-type dishmachine. It is a stand-alone machine featuring a self-contained booster heater (optional). The only external connections necessary are power supply, water supply, drainpipe, and chemical dispensers. The machine utilizes recirculated wash water and fresh water final rinse. The CMA-180 can be converted both as a straight through and corner with a door handle kit.

Operation of the CMA-180 is automatic. To initially fill the machine daily, press "Auto Fill" rocker switch. Auto Fill timer will fill the machine until water begins to flow into the scrap trap. When the door is opened and then closed, the wash cycle begins automatically. The wash tank heater will maintain the wash water temperature at 155°F. The booster heater will produce a minimum of 180°F final rinse water each cycle providing the incoming water supply is a minimum 140°F.

This machine can be used as a Low Temp machine provided NSF Standard 29 Chemical Sanitizing Feeder (not supplied with machine) is installed.

This manual is structured to provide a complete reference guide to the CMA-180. It is presented in a manner that all users will be able to comprehend and use as an effective tool in supporting the operation and maintenance of the dishmachine. The first section explains how the machine is packaged and what to look for when receiving the machine.

Instructions are provided in the manual explaining how to unpack the machine and then install and set up the machine for use. Requirements are given for plumbing, wiring, and space considerations. *These attributes of the machine are always taken into consideration by our well-trained sales representatives prior to the order being placed.* In the manual, additional installation guidance is given to ensure the machine can run at optimum conditions.

The Operation Section of the manual may be used for instruction and procedures when required. We make this portion of the manual easy to understand so that all levels of operators may be able to read and comprehend the operation of the machine. The function of the machine itself is mostly automatic and takes little training to put into full operation. The Operation Section also includes diagnostic considerations for the machine when problems occur.

We are committed to providing the best machines and customer service in the food industry and your feedback is welcome.

DISCLAIMERS

CMA expressly disclaims any and all warranties, express or implied, relating to the installation of any and all CMA equipment that is installed by chemical dealers, contracted servicers or third party servicers to CMA equipment. If the installation instructions are not followed exactly (to the letter), or, if any person or company conducting the installation of the CMA equipment, revise the installation procedures or alter the instructions in any manner, the CMA warranty becomes void. If, due to the improper installation of CMA equipment, this equipment ceases to operate properly or affects other parts of the CMA dishwashing equipment, in that the other parts become defective, the CMA warranty becomes void. CMA will not be liable or responsible or warrant CMA equipment, due to improper installation of any CMA model dishwasher.

CMA does NOT endorse "Tankless On-Demand" water heaters for use on CMA Dishmachine products. On most applications, the volume of hot water required for commercial dishmachines exceeds the capacity of these types of heating sources. You will find that most, if not all, commercial dishmachines have been programmed with auto-filling features that require quick filling, with a designated limited time.

CMA DOES endorse, and highly recommends, the standard "tank" style water heaters, sized properly to handle each particular facility with their water heating requirements. A "tank" style water heater stores and supplies a large capacity of preheated water before providing hot water to the dishmachine. To meet required health codes, there must be a reliable and consistent flow of adequate hot water supplied to the dishmachine. If the facilities' "tank" style water heater is marginal in size, CMA recommends installing a proper size Hatco Booster Heater, a CMA's E-Temp 40 or 70-degree-rise Booster Heater (that can be installed on CMA Conveyors), or a CMA Temp-Sure Booster Heater (for door and undercounter dishmachines). All are designed to adequately achieve results.

2.2. Receiving and Installation

Step 1: Remove packaging material.

Step 2: Remove service manual and machine legs from inside the wash tank.

Step 3: Install legs into dishmachine leg lockets and adjust the feet. Set the machine in place. Level the machine side – to – side and front – to – back.

Step 4: It is recommended that a distance of at least eight inches (8”) be between the table scrap sink and the dishmachine.

2.2.1. Electrical*

Prior to installation make sure the electrical supply is compatible with the specifications on the machines data plate.

WARNING: Electrical and grounding connections must comply with the applicable portions of the National Electrical Code and/or other local electrical codes.

Note: For supply connections, use copper wire only rated at 90 degree C minimum.

The control panel provides a 1” conduit connection point on the rear of the panel. Refer to Section 3 for wiring options.

This machine is equipped to handle both single and three phase applications. See Section 1: Specifications 1.1 for the proper electrical ratings.

2.2.2. Plumbing*

Minimum 140°F / Minimum 180°F (if machine ordered without booster heater, water supply ¾” – minimum 20 psi, 6 gpm flow rate and 60 gph recovery rate. Plumbing connection located on the top of the machine.

Notice to Plumber: The plumber connecting this machine is responsible for making certain that the water lines are THOROUGHLY FLUSHED OUT BEFORE connecting to the dishwasher.

Ask your municipal water supplier for details about your local water conditions prior to installation. Recommended water hardness is 3 grains per gallon or less.

Note: high iron levels in the water supply can cause staining and may require an iron filter. High chlorine levels in the water supply can cause pitting and may require a chloride removal system.

If an inspection of the dishwasher or booster heater reveals lime buildup after the equipment has been in service, water treatment is recommended. If water softener is already in place, ensure there is a sufficient level of salt.

The drain is a two inch (2”) pipe sleeve attached by “No-Hub” plumbing connection at the bottom of the scrap trap. Account’s drain should be no higher than 11” to allow the machine to drain properly.

* Electrical and plumbing connections must be made by qualified person who comply with all available Federal, State, and Local Health, Electrical, Plumbing and Safety codes

2.2.3. Chemical Dispensers*

This machine must be operated with an automatic detergent feeder and, if applicable, an automatic chemical sanitizer feeder, including a visual means to verify that detergents and sanitizers are delivered or a visual or audible alarm to signal if detergents and sanitizers are not available for delivery to the respective washing and sanitizing systems. Please see instructions for electrical and plumbing connections located in this manual and in the feeder equipment manual.

1. Check valves should be installed directly at the mixing chamber coupling located by the vacuum breaker on the back of machine. There are two 1/8" FPT mounting holes provided on the mixing chamber coupling, which will position the check valves parallel to the machine avoiding any chemicals from dripping onto the stainless steel should a leak develop. One hole is for rinse chemical and one for sanitizer chemical, but only one is needed with the High Temp machines — for rinse chemical only.
2. Remove the plugs from the mixing chamber; and install injection fittings (supplied with your dispenser).
3. A 7/8" detergent injection hole is provided in the back of the wash tank. Remove the S.S. plug and install the detergent fitting (supplied with your dispenser).
4. A 7/8" chemical probe hole is provided in the front of the wash tank heater just below hi limit switch. Insert the probe into the hole from inside the wash tank and secure it with the probe retaining nut provided.

2.2.3.1. Low Temperature Applications

See dispenser manufacturing operational instructions for sanitizer adjustments for Low Temp applications.

The sanitizing pump operates when the fresh water enters the machine during final rinse. The water is treated at 50 PPM (parts per million). The pressure regulator is adjusted to 20 PSI. This allows 0.82 gallons of water to enter the machine each time a rack is washed.

It is recommended that the 5-1/4% chemical solution be standardized to allow uniform dispensing of the sanitizing solution into the flow of rinse water as the machine operates. At this level, maximum shelf life is available.

Note: Use only commercial-grade detergents and rinse aids recommended by your chemical professional. Do not use detergents and rinse aids formulated for residential dishwashers.

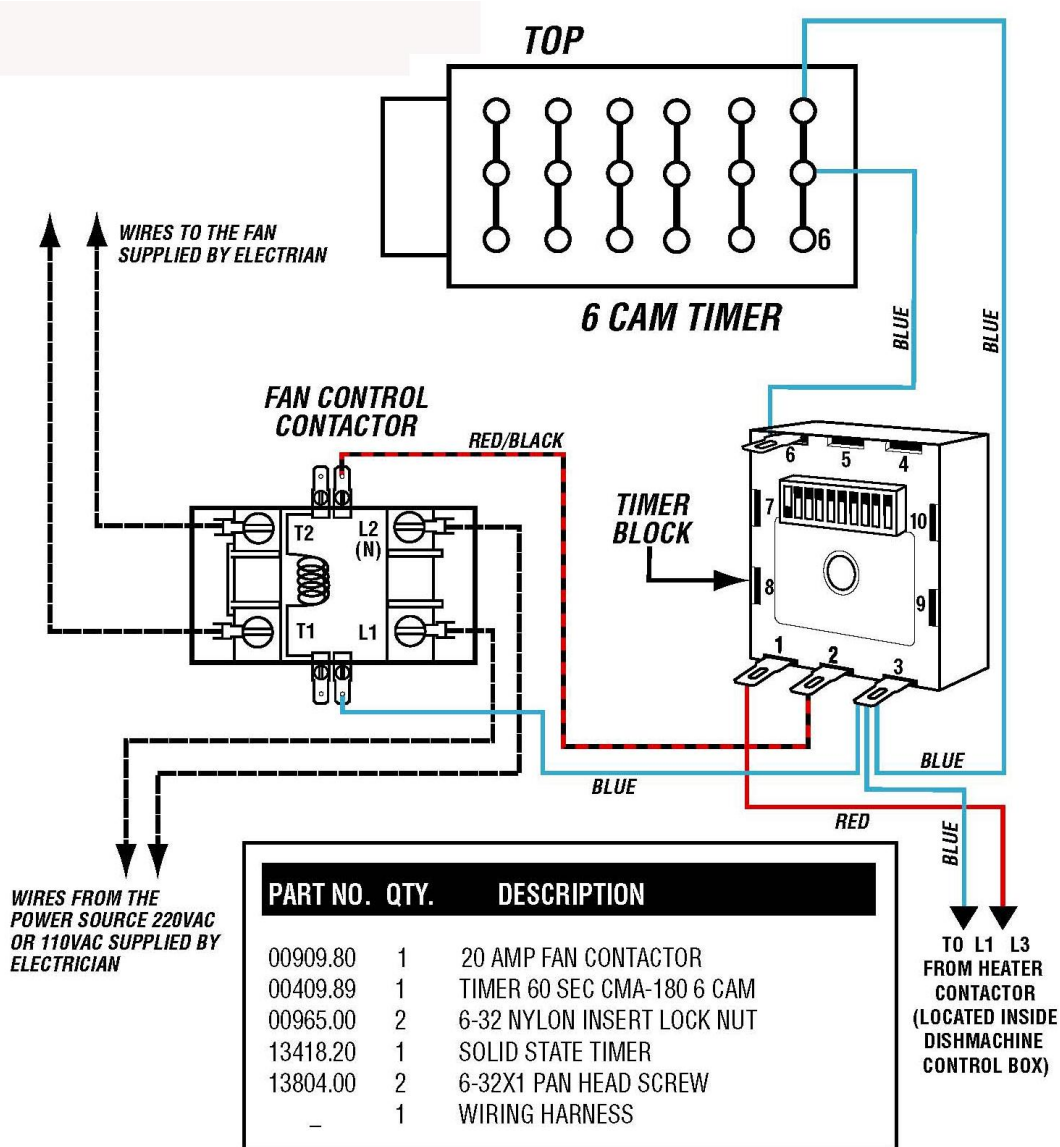

Low Temperatures chemical-sanitizing dishmachines must not exceed 6% sodium hypochlorite solution (bleach) as the sanitizing agent. Higher levels may damage stainless or components.

Follow the directions precisely that are on the litmus paper vial and test the water on the surface of the bottom of the glasses.

* Electrical and plumbing connections must be made by qualified person who comply with all available Federal, State, and Local Health, Electrical, Plumbing and Safety codes

2.2.4. Exhaust Fan Control Kit p/n 17528.00 Instructions

1. Connect terminal #1 on timer block (Red) to heater contactor terminal marked L3
2. Connect terminal #3 on timer block (Blue) to heater contactor terminal marked L1
3. Connect terminal #2 on timer block (Red/Black) to fan contactor coil terminal.
4. Connect terminal #3 on timer block (Blue) to other fan contactor coil terminal
5. Connect terminal # 3 on timer block (Blue) to sixth cam top terminal on timer assembly.
6. Connect terminal #6 on timer block (Blue) to sixth cam middle terminal on timer assembly.
7. Connect power source of 220 Vac or 110 Vac to L1 and L2 (N) on fan control contactor.
8. Connect exhaust fan motor to T1 and T2 on other side of fan control contactor.

2.2.5. Water Tempering Kit (Optional)

CMA-180, EST-44, EST-66 WATER TEMPERING VALVE KIT P/N 13470.10

ITEM NO.	P/N	NO REQ'D	DESCRIPTION
1.	00400.00	2	CONDUIT 3/8" SEALTITE
2.	00401.00	1	ST-3/8" STRAIGHT CONNECTOR
3.	00402.00	1	ST-90 DEG 3/8" COONNECTOR
4.	00742.00	1	NIPPLE BRASS 1/2X1-1/2"
5.	03101.00	1	HOSE CLAMP #16 1"
6.	03106.45	5	BRAIDED HOSE 1/2"
7.	03603.15	1	WATER SOLENOID VALVE 1/2"
8.	41030.10	1	1/2" 90 DEG. ELL X F BRASS
9.	13472.00	1	NIPPLE PVC 1/2" X CLOSE
10.	13472.40	1	ADAPTER PVC 1/2" MALE X 1/2" BARB
11.	13472.50	2	ELBOW PVC 90 DEG F X BARB
12.	14508.50	1	PLUMBING BRACKET (180-UC)
13.	00738.15	1	SOLENOID VALVE COIL 220V
14.	41062.00	1	1/2" STRAINER BALL VALVE

2-2013

2.2.6. Installation Checklist

- Dishmachine checked for concealed damage.
- Hot water supply is 140° (60°C)
- Incoming water supply line is ¾”.
- Incoming water supply is 6 gpm minimum capable at 20 psi flow pressure.
- Machine circuit breaker is properly sized.
- Service voltage and phase type are correct to machine data plate.
- High leg of voltage is connected to L2 (three-phase).
- Dishmachine is properly ventilated.
- Floor drain plumbing is installed with air gap. **MUST MEET LOCAL CODES.**
- Dishmachine is properly grounded.
- Dishmachine is properly leveled.
- Dishrack guides are adjusted to level of dishtable.
- Machine circuit breaker is labeled D/W

2.2.7. Machine Start-Up Procedures for High Temp machines.

1. Place the scrap baskets over the wash tanks.
2. Secure the wash & rinse arms and check the free-spin.
3. Open the control panel and select ‘normal” toggle switch position.
4. Adjust the rinse pressure to 20 PSI flow pressure using the regulator and the gauge provided on machine.
 - a. Turn the power switch to the “Off” position.
 - b. Close doors and press “Auto Fill” rocker switch;the water overflows into the scrap trap.
 - c. Turn the power switch to “on” position. *SEE NOTE FOR BOOSTER HEATER BELOW.*
 - d. While holding “flush” toggle switch, to activate the water solenoid, adjust the pressure regulator until the gauge reads 20 PSI. *NOTE: Booster heater is filled during this procedure.*
5. Connect the detergent and rinse dispenser to the power block supplied & labeled inside the control panel (208-220) volt.
6. Remove the plug from the mixing chamber and install the rinse injection fitting.
7. A 7/8” chemical probe hole is provided in the wash tank behind wash tank heater cover.
8. A 7/8” detergent fitting hole is provided in the wash tank behind the machine.
9. Check the machine operating temperatures. Adjust if necessary.
 - a. After the machine has warmed up for five to ten minutes (5 – 10 min.), observe the wash and rinse temperatures. The wash temperature must be 155°F

minimum. The rinse temperature must be 180°F minimum. If necessary, adjust the temperatures by removing the panel in front of the respective heater and turning the adjustment stem clockwise to increase.

NOTE: Rinse water temperature must be observed during the rinse cycle.

10. Check all water and drain fittings for leaks.
11. Install the wall chart and instruct the machine operator on the proper cleaning and operation of the CMA-180.

Caution: Booster Heater

Booster heater is shipped on the dishmachine empty to prevent freezing. When the machine is powered up for the first time, the booster heater must be filled immediately to prevent damage to the heating element. See Section 2.2.7 (4d.)

To prevent booster heater element damage, CMA has removed a wire from the high limit switch. When initially filling of a newly installed dishmachine, you must fill the booster tank prior to connecting the removed wire. When water is observed entering the wash tank this indicates the booster tank is full and removed wire can be connected. Failure to follow these important instructions will destroy the heating element because of dry -firing.

2.2.8. Electrical Requirements

The CMA-180 comes standard factory, wired for 3-phase operation. Check the electrical data plate to confirm this. Refer to “Electrical Requirements” Figure 1-A, for proper wiring instruction for both rectangular booster and wash heaters conversion. Also check the wiring diagram to properly wire the terminal power block, tank heater, and booster heater for 1 phase (or 1B diagram below). Refer to Figure 1-B, for proper wiring instruction for both triangular booster and wash heaters conversion.

SINGLE PHASE POWER

NOTE: See “Wiring options” section for 1-phase power supply.

DISPENSER HOOK-UP

1. The power signal is 208/230 volts. The power block is labeled inside the control box. Conduit holes for both detergent & rinse are supplied on the control box.
2. A threaded (1/8") injection point is provided on the final rinse Teflon mixing chamber located off the back of the machine.
3. A (7/8") hole is provided in the tank for a probe access. It is located on the front side of the wash tank inside the heater cover.

MAIN POWER CONNECTION

Please refer to the machine data plate or choose one of the five (5) power connections illustrated above. Electrical requirements are shown for machines with or without booster heater, three or single phase.

WARNING: Insure that the machine is properly grounded and complies with all local and national codes. Injury or death may occur from shock, if the machine is not properly grounded.

Install power supply wires, L1, L2 and L3 (3-Phase) to the appropriate terminals marked L1, L2, and L3 on the power block. (If applicable, the high or "wild" leg must be connected to the L2 Terminal.)

4. Quick service guide

MODEL: CMA 180 HIGH TEMP

TECHNICAL ISSUE	CAUSE	SOLUTION
Door magnetic reed switch problem	Faulty magnetic reed switch	Check wire connections inside control box Contact factory for new retrofit, corner P/N 00566.10 straight P/N 00566.20
	Door mechanical switch problem
